

Figure 1. "50-metre depth slice" of inverted IP chargeability data at the Lense 7/8 Target – showing the chargeability of the modelled source of IP anomalies, 50 metres below the surface, together with previous drilling in the vicinity. (It is noted that the 50m depth slice doesn't highlight the entire length of the Lense 7/8 IP Target, as the depth of this anomaly varies along strike).
