

(A-D) Gold-quartz veins from bedrock in the 2016 Otter Creek Mines pit (A) Gold-quartz vein within foliation of light-coloured phyllite. Green-tinted white blocky crystals labelled “Ab” are probably albite. (B) Gold-quartz vein appears to cut across a second cleavage, S_{n+1} , in black phyllite. (C) Gold-quartz vein follows cleavage in black, graphitic phyllite, and gold extends into country rock along foliation. (D) Gold-quartz vein in black phyllite (*BCGS Paper 2017-1, page 185*).
