Status of Construction Activities at the Etango Heap Leach Demonstration Plant

**Plant Design & Layout**

Sample Preparation
Waste and ore material was blasted within the Onkelo region of the deposit and is being transported to the plant site. The blended material will be separately crushed in a three stage crushing process including high pressure grinding rolls to deliver a product specification similar to the orefeed characteristics assumed in the Definitive Feasibility Study (“DFS”).

Rehabilitation of the areas from which the ore and waste sample were sourced has already commenced.

Site Establishment
Site levelling and establishment of the office infrastructure has been completed. Movement around the plant site has been restricted to designated areas only to minimise the disturbed footprint.

Heap Leach Cribs
The first concrete pour of the crib walls has been completed.

Evaporation Pond
The civil works on the evaporation pond have been completed and will shortly be followed by installation of the double plastic liners.
