

Section A-A' (Lucky John-JSLA)

*See the PEA for additional details which is available on SEDAR at www.sedar.com.

CMM-054 (Lucky John Extension) is located approximately 95 metres to the northwest of the Lucky John high-grade mineral zone along strike, and approximately 100 metres from the previously mined high-grade zone in JSLA. The high-grade intercept appears to be focused along a structural zone connecting JSLA to Lucky John with lower grade selvages. The corridor between JSLA and Lucky John is relatively sparsely drilled.
