

Section B-B' (Lucky John-JSLA)

*See the PEA for additional details which is available on SEDAR at www.sedar.com.

CMM-060 is located in a relatively sparsely drilled area approximately 150 metres southeast of Lucky John towards the South JSLA mineral zone. Mineralization is hosted in a complex rhyolite sequence that is deeper than predicted by surrounding drill holes, and is located in the footwall of the modeled contact of the Big Chief Rhyolite Plug. The drill hole bottomed in 2+ g/t material and is open at depth as well as horizontally in several directions.
