

Figure 1. Satellite image of the Segala Ouest project area. Infill colours are relative soil geochemical values with the blue colouration being background below 20 ppb Au. The yellow to red colours reflect the spread of anomalous values. The neighbouring producing mines are identified, viz.: Endeavour's Segala and Tabakoto mines (with a published resource of 3.28 Moz) and Randgold's Loulo-Goukoto mine complex (with a published resource of 13.4 Moz).
