**NOTES:** Previous drilling results completed after the NI43-101 mineral resource study were reported in a news release dated October 17, 2011. The mineralized intervals reported in this news release represent core lengths. True width where it has been determined in the South and North Zones is 47%-85% of the core lengths. For holes BG-35, -87, -136,-149, -154, -157 and -158 true width ranges from 26%-41% of the core lengths. Holes BG11-153A and BG11-160 were stopped short of target. Hole \*BG10-65 was previously released and is restated as a result of new sampling. BG11-84, 88, 91, 133, 137, 141, 145, 146, 147, 154, 160, 166, 167, 173, 175, 176, 177, 183, 188, 191, 193, and 201 returned no significant values. The holes were not drilled in numerical order. Mineralization generally consists of 10-90% coarse disseminated pyrite, 1-20% chalcopyrite hosted in an altered, silicified, iron-rich diorite and porphyry along the Bidgood gold structure. The mineralization mined at Bidgood generally strikes northeast – southwest.
