

Figure 1: Location of the Korkan-Bigar trend and the Kraku Pestar target area within the 20 kilometer long sediment-hosted gold belt (defined in this image by anomalous gold soil geochemistry). The total metal contour plots for Korkan, Bigar Hill and Kraku Pestar have been superimposed on the sediment-hosted gold belt as defined to date. The Vizur target area has also been highlighted approximately 3 kilometers north of Korkan discovery hole (KODD001).
