

FIGURE 2: Cross-section 1007170N looking north for holes SCD-001 to SCD-007. Analytical results for iron are represented as bars on right side of drillhole traces. West-directed thrust faulting has resulted in a moderate folded geometry. Fault traces and minor displacements have been omitted for clarity (thickening and thinning of the ironstone is most likely related to faulting). Ironstones sub-cropping on dip-slopes (central and eastern zones) provide excellent potential for zero-strip extraction zones.
