

Figure 1

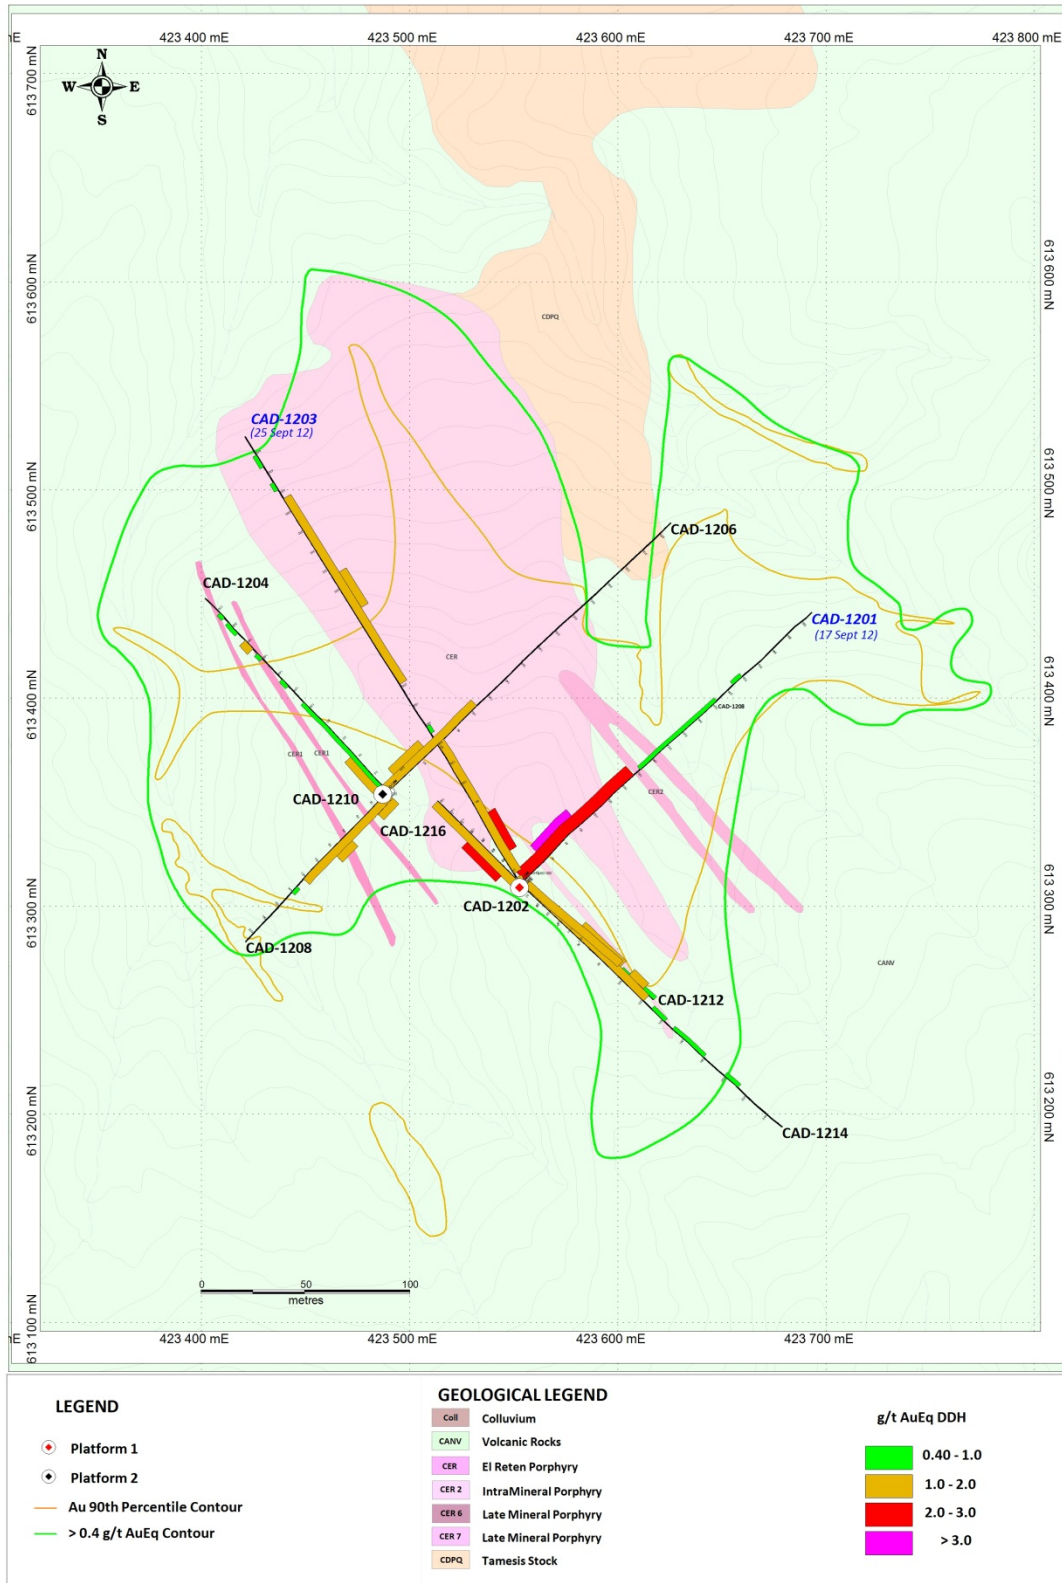

Figure 1: Map of El Retén sector showing surface traces of all ten drill holes completed to-date as well as interpreted surface geology and geochemical anomalies – the orange line shows the 90% percentile gold anomaly used in previous Press Releases and the green line shows the newly defined surface expression of the El Retén anomaly based on a 0.4 g/t AuEq cutoff. New drill holes discussed in this Press Release are shown in black, with previously announced drill holes shown in blue with the date of publication.
