

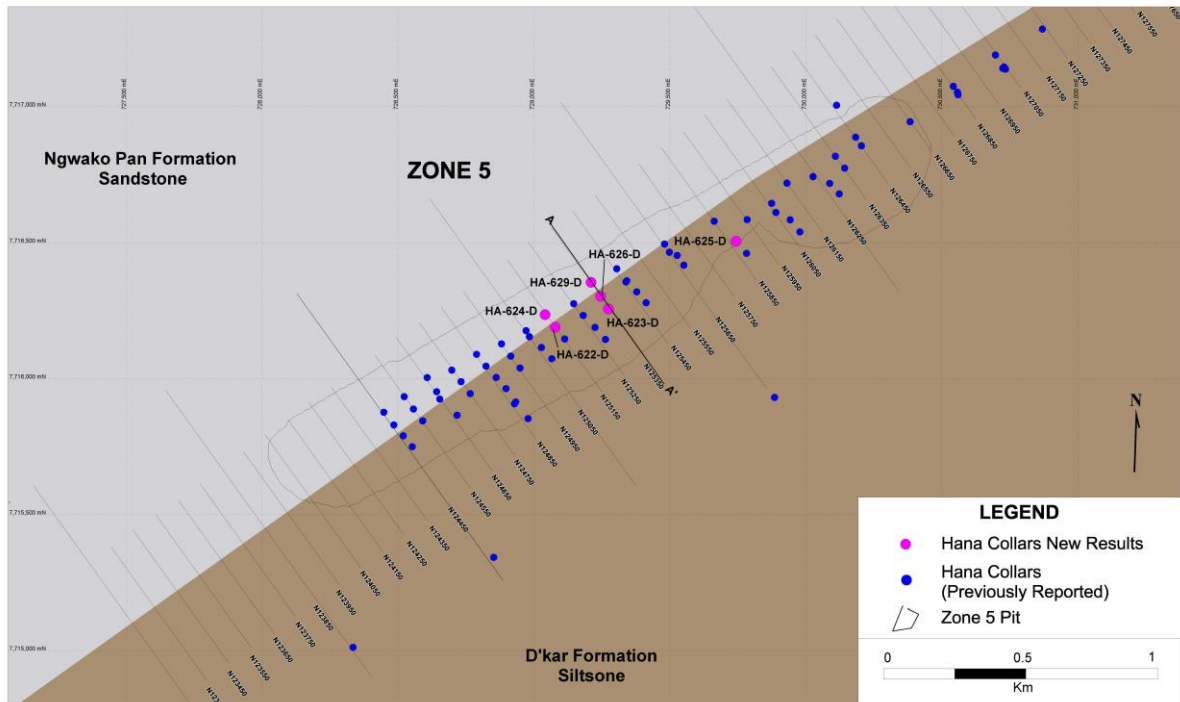

Figure 1: Location of Zone 5 Drilling Results at the Ghanzi Project, Including Sections N125150 to N129350

*Please note all figures are now showing section grid lines that are referenced in the result tables.

Figure 2: Cross-section through N125350 at Zone 5, showing infill resource drilling; large widths of copper-silver mineralization from three drill collars. High-grade copper mineralization is associated with chalcopyrite, chalcocite and bornite mineralization that occurs as disseminations and/or veinlets found predominately within the siltstone and marl units, but are also commonly found within the carbon rich siltstone and limestone units.
