

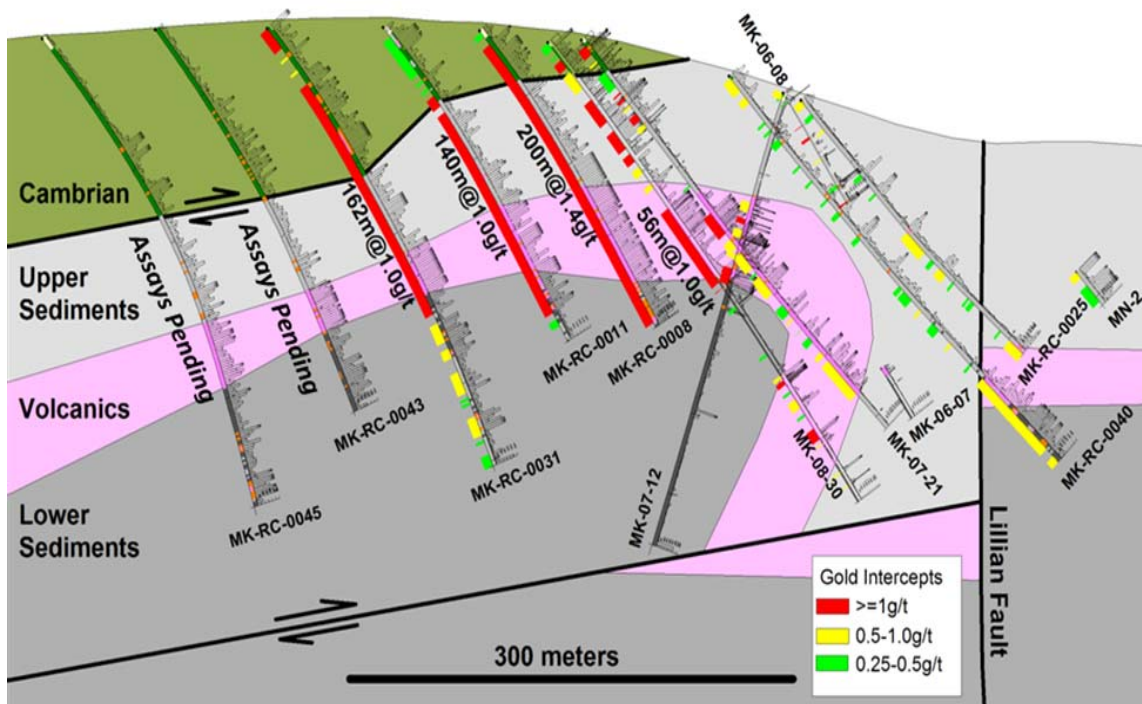

**Figure 1.** Plan map showing distribution of ITH drilling and status of assaying as of September 2, 2008. Drilling has tripled the size of the 2007 drill area, focusing on expanding higher grade Core Zone. The collars of holes with continuous intercepts of greater than 50 metres width and >1 g/t gold are highlighted.

Section 428925 illustrating the general geology of Livengood deposit and distribution of gold mineralization. Histogram on the right side of the drill traces reflect the arsenic content which has a high correlation to gold (note pending holes).
