

(Figure 1: Schematic section through the Osgood Mountains to the ATV project, looking northeast. Structural modeling by NV Gold suggests favorable sedimentary host rocks for Carlin style mineralization potentially underlie the ATV project at shallow depths. A thin veneer of young gravels and volcanic rocks (yellow) overlie Paleozoic sedimentary rocks (purple). Red indicates gold mineralization or potential gold mineralization at ATV. Depth to favorable rocks is thought to be within a few hundred meters of surface within much of the ATV project area.)
