

Illustration: Three dimensional geological model for Renard 2 as utilized in the December 2008 NI 43-101 compliant mineral resource statement (solid), and as updated to show the potential mineral deposit following the recent drilling (transparent). Views are from the east (left) and south (right). The models show the relative location of the new drill holes discussed above, as well as historical drilling. Present surface is at about 510m above sea level with vertical scale as shown. Kimberlite intersections in green, brecciated country rock +/- kimberlite in pink, and country rock in white.
