

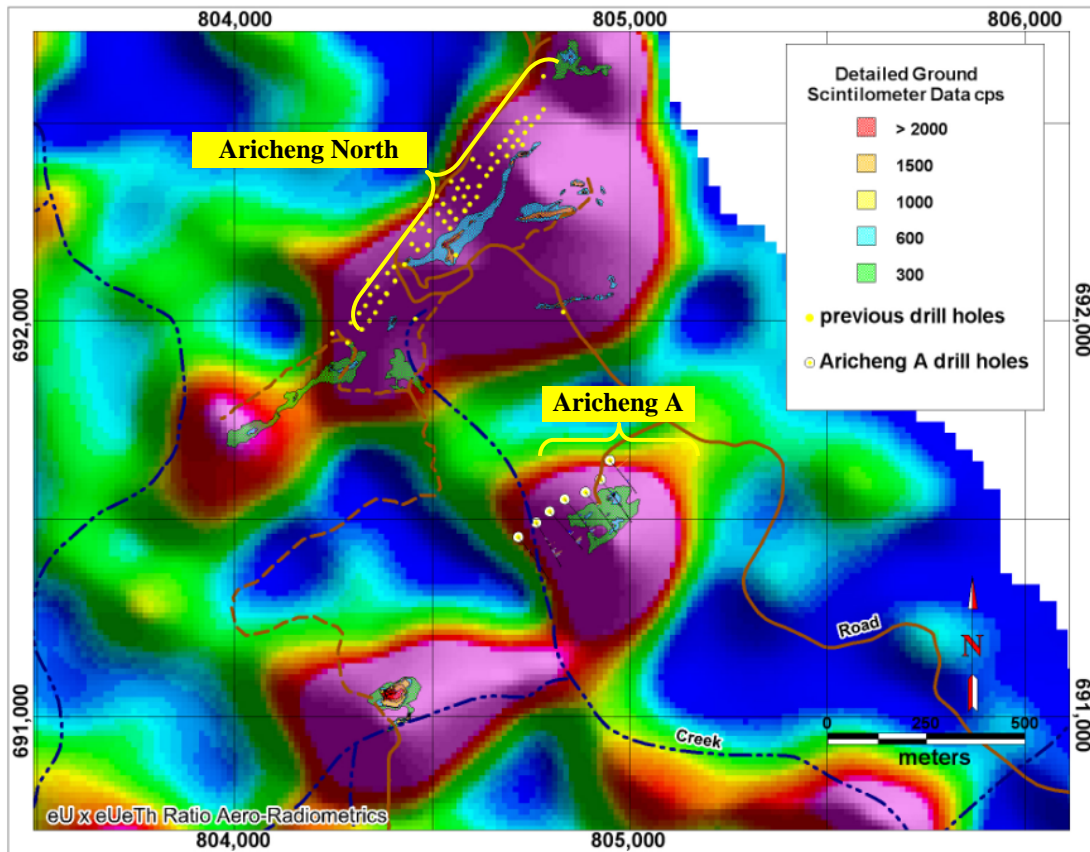

Figure 2 – Drill Hole Locations at Aricheng A

Plan view of the location of the seven bore holes drilled in the scout drilling program on the Aricheng A target (results reported in this press release). The collar position of each hole is shown as a yellow dot. The coloured background is radiometric data from a field survey (warm colours indicate areas with higher radioactivity). Aricheng A is located on a conspicuous radiometric anomaly, which is situated southeast of the uranium zone previously drilled at Aricheng North, marked by another strong radiometric feature.
